The abundance of Cdc6 in mammalian germinal vesicles (GM) suggests that Cdc6 might be a regulator of the initiation of DNA synthesis in the meiotic cycle. Unexpectedly, the content of Cdc6 in mouse oocytes can be maintained during 5-8 h of preovulatory estrous period. In contrast, human and bovine Cdc6 in oocytes is maintained in the cytoplasm for an extremely long period. Here, we show that the absence of Cdc6 affects the progression of meiotic division in human and bovine oocytes. We also provide evidence that the intact Cdc6 protein is e24f408de9
