- - - - -

```

## What's New in the?

Jiggy is a cross platform, easy to use JIRA client designed around a developer's daily activities. Basic functionality includes creating issues, adding comments, and progressing workflow. Features: \*

- \* Quickly create and manage issues on your JIRA instance
- \* Create and comment on issues in a single interface
- \* Generate and execute JUnit and Artisan tasks with a single click
- \* Progress workflow
- \* View JIRA issue details
- \* Work seamlessly with your own Jira instance
- \* Bug Tracker functionality

Integration with Travis CI \* Easy for developers to create and maintain the source code \* Supports multi-language \* Many other features

Requirements: Jiggy is compatible with JIRA v6.2 and later.

Installation: If you have a fully functional JIRA instance, just download the Jiggy jar and put it somewhere on your hard disk, preferably in the JARs directory, and unzip it to a path where you want to put Jiggy, and call "java -jar jiggy-.jar" from there. Run as: When installing, you have the option to run Jiggy as a Windows service or as a console application. When running as a console application, you can start a new console application, or just start it when already running. Installation on Windows: To run as a Windows service, just select the "run as a Windows service" option when installing. This will generate a file to run Jiggy as a Windows service. This can be used for system-wide installation, as well as a console application for starting Jiggy. Configuring: Jiggy provides a config file at config/jiggy.json, which defines various parameters. The config file can be specified as an argument to the Jiggy command line. This can also be set by setting a variable in the environment on your Linux or Unix based system, as shown below: export JIGGY\_CONFIG\_FILE=/path/to/config/jiggy.json To view the config file, run Jiggy with the -c option. If you do not specify a config file, Jiggy uses a default configuration. Start Jiggy: If you run Jiggy as a console application, simply type in "java -jar jiggy-.jar" and Jiggy will start in a shell. Workflow: For the normal workflow, your JIRA issue becomes the issue which represents the thing you are trying to track, and all comments are made in the issue. You can also specify a team in the config file, in which case the comments will be made by the team that owns the issue. In this way, a team can progress workflow for different issues as a group. Getting and Creating Issues:
